

DarsLoop AI

A study workspace for Islamic classes

Automatic notes with the original source beside them

Hamza Adam
Solo entrant, Track 3

The founder's study problem

During class

Writing a sentence can mean missing the next explanation.

After an absence

Returning to a classmate's recording takes time.

During revision

A few days later, the lesson can be difficult to recall.

Founder observations. No population or learning-outcome claim.

The student workflow

- 1 Record or import permitted material
- 2 Choose note detail and study language
- 3 Read automatic notes and check sources
- 4 Ask this lesson and practise

Actual authored PDF screen. Personal edits stay separate.

The source behind an explanation

Exact captured quotation

Original audio time or
physical PDF page

Selected lesson and source
version

Unsupported or flagged passages stay
out of prepared study items. Source
checking cannot prove every
transcription is correct.

Genuine extracted pages from an authored fictional PDF

Study language and private PDF resources

Auto, Arabic, Urdu or English

Choose the language of study material. Original quotations keep their source language.

A source when recording is unavailable

Private selectable-text PDF passages cite genuine pages. Scanned PDFs and OCR are outside this build.

PDF bounds: 8 MB, 40 physical pages, 80,000 extracted characters.

Native language quality and code-switch fidelity still need qualified review.

Actual Arabic study material

Practice with the captured lesson

Quiz and flashcards

A mock exam with supported multiple choice, True / False, literal blanks or written recall

Counts follow available source items.

Written recall uses a separate self-check. It never receives an AI religious grade.

Prepared fictional quiz. Sources appear after answering.

Revision with a route back to the source

Catch me up returns to supported points after an absence.

Teacher's terms retain the lesson's own wording.

Study Plan uses actual due and missed items.

The added value is continuity with a particular source. Learning benefit remains unmeasured.

Source feedback from an actual prepared example attempt

Mechanism and safety boundaries

Actual stack

Next.js and React interface
Node.js routes and durable worker
FFmpeg for audio preparation
Supabase identity and private storage
Groq transcription with comparison
Gemini generation and support audit
PDF.js page extraction

Source and account boundaries

Literal quotes and current source version
Private access and share revocation
Detected uncertainty withheld
Personal rulings and hadith grades referred
Optional source-first teacher question
Personal notes separate from evidence

Both recognizers can share an error. Flags and audits are fallible. Teacher approval is outside this build. Phone screen lock can interrupt recording.

Verified operation and continuation

121.374 s

Processing

55.112 s

Upload

878 timed segments

841.5 MB peak memory, zero OOM kills

One hosted hour of repeated authored English speech, sequential dual ASR and generation.
These measurements do not establish general performance.

\$0 new cash spent. Free allowances and trial hosting remain finite.

Durable queue and manual backups exist. Full hosted backup switching, two-hour performance and concurrent load remain unproved.

Evaluation and access

Future benefit evaluation

Compare comprehension, supporting-passage retrieval and later recall on the same permitted lesson. No student pilot or measured improvement yet.

Working app and public code

<https://darsloop-production.up.railway.app/example>

<https://github.com/leowork2006-hash/DarsLoop>

Starting version and provenance

Registration concept and September deck existed before 4 October.

The implemented app and release evidence cover 4–6 October.

Hamza Adam built with AI assistance. Actual history remains disclosed.
